

# Male urinary incontinence

You are not alone; we can help you treat and manage male urinary incontinence.

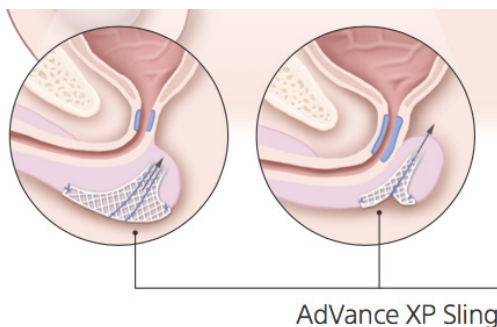

Urinary incontinence (UI) is the loss of urine control and is fairly common and often treatable in men. Symptoms can range from small leaks and dribbling, to complete lack of control. UI may be a short-term problem caused by another health issue, or a long-term problem that you'll have to manage. Either way, we are here to help.

## Early detection and treatment of urinary incontinence often result in better outcomes.

Treatment for urinary incontinence depends on different factors, such as the type of incontinence and how severe it is, age, symptoms, and overall health. Minimally invasive surgeries for urinary incontinence are great to use to control urine flow in some cases. Check out the options here at **West Jefferson Medical Center Urology**.

## Male Urethral Sling

The AdVance™ XP Male Sling System is a synthetic mesh-like surgical tape that is placed in the area of the urethra that is causing a problem. It acts as a "hammock," repositioning and supporting the urethra to help restore normal bladder control. The sling helps keep the urethra closed, especially when coughing, sneezing, and lifting and allows the patient more control over their bladder, reducing leaks.

## Artificial Urinary Sphincter

The AMS 800 Artificial Urinary Sphincter, a working mechanism, is a three-part urinary control system that is contained completely in the body used for men who have become incontinent because of their urinary sphincter. It is placed inside the body, where the fluid filled cuff helps keep the urethra closed and a pump allows urination on demand.
